Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The specification describes an isolated HLYA-CC (HLYA-1) given in ABB08900. The specification describes an isolated HLYA-CC polypeptide or a nucleic acid that encodes it. The invention has cytostatic, nootropic, anticonvulsant, cerebroprotective, virucide, certification continuous anti-HIV, antiparkinsonian, antibacterial, antidiabetic, antinanaemic, antisthamatic, antiatherosclerotic, immunosuppressive, antianaemic, antistrathritic, dermaclogical, fungicide, antiparsitic, dermatological, nephrotrophic, thyromimetic, osteopathic, antiparatic, continuous presentic, immunosuppressive, continuous pe used to soreen for potential HLYA agonists of the invention may be used to soreen for potential HLYA agonists of the protein of the invention may be used to soreen for potential HLYA agonists of antagonists, detect the presence of HLYA-associated disorders are used to soreen for proteins and polynucleotides are useful in diagnosis, treatment and prevention of immunological disorder e.g. ALDS, allergy, anaemia, asthma infection, Crohn's disease, multiple scleroke, muscular dystrophy, Down's syndrome, myasthenia gravis; glaucomes of HLYA polynucleotides are used for creating humanised/transgenic animals concorded in the protein of the HLYA proteins glaucomal location due to e.g. translocation, generating a transcript chromosomal location due to e.g. translocation, generating are used for diagnosis of HLYA-associated disorders or monitoring are used for diagnosis of HLYA-associated disorders or inhibitors of the HLYA are concorded in the presence of the premoved of the presence of the premoved of the presence of the premoved of the presence of the presenc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

This invention describes a novel disease detection and treatment molecule polypeptide (MDDT) which has anti-inflammatory, immunosuppressive, osteopathic, article, anti-HIV, haemostatic, nephrotropic, esteopathic, cytostatic, anti-HIV, haemostatic, nephrotropic, antianaemic, antipsoriatic and hepatotropic activity. The polymucleotides and the polypeptides of the invention can be used for gene therapy, protein replacement therapy and are useful for treating a variety of diseases or conditions. These polypeptides or polymucleotides are particularly useful for diagnosing, treating or preventing cell particularly useful for diagnosing, treating or preventing cell comparation, melanoma, myeloma or sarcoma), anaemia, Crohn's disease, acquired immunodeficiency syndrome (AIDS), Goodpasture's syndromes, inflammation, osteoporosis, thrombocytopaenia, psoriasis or comparation, osteoporosis, thrombocytopaenia, psoriasis or ABUI1450-ABUI1845, described in the disclosure of the invention. NOTE:

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the way way and the printed control of the control of the control of the control of the c
                                                                                                                                                                                                                                              New purified disease detection and treatment molecule proteins and polynucleotides, useful for diagnosing, treating or preventing cancers (e.g. leukemia or sarcoma), anemia, Crohn's disease, AIDS, osteoporosis or hepatitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invertion relates to polymucleotides (1) encouring diagnostic and the preceding involved in growth and development and receptors. (1) and (11) proteins involved in growth and development and receptors. (1) and (11) associated with inappropriate DITHP expression. For example, (1) and (11) may be used to treat disorders associated with decreased polypeptide expression by rectifying mutations or deletions in a patient's genome, that affect the activity of the DITHPs, by expressing inactive proteins or supplementing the patient's own production of them. (1) and (11) may be used to treat diseases, for example, cell proliferative disorder. (2 crohn's disease, acquired immune deficiency syndrome (AIDS), lymphoma, (1) may be used to produce the DITHPs, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (1) and tis complementary sequences may also be used as DNA probes in diagnostic samples, and therefore which patients may be in need of restorative therapy. (11) may also be used as antigens in the production of therapy. (11) may also be used as antigens in the production of therapy. (11) may also be used as antigens in the production of the captodise against DITHPs antibodies and antagonists may also be used to down regulate expression and activity. The anti-DITHP antibodies and antagonists may also be used to down regulate expression and activity. The anti-DITHP antibodies and antagonists may also be used as diagnostic agents for detecting the presence of DITHPs in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). AASJ31986-AASJ3196 represent human diagnostic and therapeutic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human enzymes designated NZMS and nucleic acid molecules encoding such proteins. Sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of NZMS. The disorders treated include cell proliferative disorders such as hepatitis, psoriasis, cancer (e.g. leukaemia), altonimum edisorders such as diabetes, acquired immume deficiency syndrome (AIDS)), cardiovascular disorders such as arteriosclerosis, hypertension), gastrointestinal disorders (e.g. anorexia, gastritis), neurological disorders (e.g. epilepsy, dementia), pulmonary disorders (e.g. embolism, asthma), reproductive or eye disorders. Polypeptides of the invention is useful in a number of drug screening techniques and to analyse the proteome of a tissue or cell type. They are also useful as elements on a microarray. Polynucleotides of the invention are useful for creating knockin humanised animals or transgenic animals to model human diseases, in somatic or germline gene therapy, to generate a transcript confined on the chromosomal location due type, for detecting difference in the chromosomal location due translocation or inversion among normal, carrier or affected individuals and as hybridisation probes for mapping anturally occurring genomic sequences. The present sequence is human NZMS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TTCACTGGAAGGAATTTTTCCCTATTGCTGATGGTGATCAGCAATCTCCAATTGAGATTA 136

useful for producing non-human transgenic animals which are useful for studying the function and/or activity of NOVX protein and for identifying and/or evaluating modulators of NOVX protein activity. The NOVX nucleic acids can be used in gene therapy. This polymucleotide sequence represents a NOVX DNA sequence of the invention

New polypeptides, designated as NOVX, useful for diagnosing and treating infections, neurological diseases, cancer, allergy, and bone, immunological, skin, renal, brain, muscle and autoimmune disorders.

Claim 9; Page 65-66; 672pp; English.

The invention relates to a novel isolated polypeptide, designated NOVX (NOV1 - 33), consisting of a mature form of one of 6 l sequences, given in the specification, or its variant, where amino acid residue(s) in the variant differs from the mature form, provided that the variant differs in the wariant be mature form, provided that the variant differs in corn more than 15 % of the amino acids from the sequence of the mature form. The NOVX polypeptides, are useful for treating or preventing a natibody to the polypeptides, are useful for treating or preventing a natibody to the polypeptides, are useful for treating or preventing a natibody to disease associated disorder). NOVX polypeptides and converse of the mature of acids, are useful for determining the presence of or predisposition nucleic acids, are useful for determining the presence of or predisposition or a disease associated with altered levels of NOVX polypeptide and polymucleotide, by measuring the level of polypeptide comparing the mammal not having or not predisposed to the disease. NOVX polypeptide is also useful for identifying an agent that modulates the expression or that useful for identifying an agent that modulates the expression or activity of NOVX. The antibodies and a colypeptide specified specified specified is also useful for determining the presence or amount of NOVX in a sample. NOVX colypeptides, polypudical state in a mammal. The antibodies are also useful for determining the presence or amount of NOVX in a sample. NOVX colypeptides, polypeptides are useful for treating a pathological state in a mammal. Protozoal, and parasitic colypeptides, polypeptides are useful for treating or preventing disorders or synthomes infections. They can also treat disease or a stroke. The NOVX activity. NOVX sequences are also useful conferences from very small biological samples such as e.g., Alzheimer and to modulate NOVX activity. NOVX sequences are also useful conferences from very small biological samples such as e.g., charco conferences from very s

2003-058504/05. P-PSDB; ABJ37886. New polypeptides, designated as NOVX, useful for diagnosing and treating infections, neurological diseases, cancer, allergy, and bone, immunological, skin, renal, brain, muscle and autoimmune disorders.

Claim 9; Page 66-67; 672pp; English.

The invention relates to a novel isolated polypeptide, designated NOVX (NOV1 - 33), consisting of a mature form of one of 61 sequences, given in the specification, or its variant, where amino acid residue(s) in the variant differ from the mature form, provided that the variant differs in not more than 15 % of the amino acids from the sequence of the mature

cc form. The NOVX polypeptides, nucleic acids encoding the polypeptides, and an antibody to the polypeptides, are useful for treating or preventing a NOVX-associated disorder in humans and for treating a syndrome associated with a human disease (NOVX-associated disorder). NOVX polypeptides and the encoding nucleic acids, are useful for determining the presence of or predisposition to a disease associated with altered levels of NOVX copypeptide and polynucleotide, by measuring the level of polypeptide amount of nucleic acid from a mammal and comparing it expression or the amount of nucleic acid from a mammal and comparing it onlypeptide is also useful for identifying an agent that binds to NOVX and a cell expression or activity of NOVX. The antibodies and also confusites the expression or activity of NOVX. The antibodies and also confusite the presence or amount of NOVX polypeptide are useful for identifying an agent that the presence or useful for determining the presence or amount of NOVX polypeptides are also cuseful for teating a pathological state in a mammal. The antibodies are also cuseful for determining the presence or andulates propertides and antibodies specific for the polypeptides are useful for colluding trauma, viral, bacterial, fungal, protozoal, and parasitic inflections. They can also treat disorders such as e.g., Alzheimer's cliffections. They can also treat disorders such as e.g., Alzheimer's cliffections. They can also treat disorders such as e.g., Alzheimer's cliffections. They can also treat disorders such as e.g., Alzheimer's cliffections. They can also treat disorders such as e.g., Alzheimer's cliffections. They can also treat disorders such as e.g., Alzheimer's cliffections. They come on condulate NOVX encoding nucleic acids are also or expressing the NOVX proteins, to detect NOVX MRNA, or a genetic lession in a NOVX sequences from very small biological samples such as princes from very small biological samples such as printended for identifying and/or cloning NOVX homologues in other c acids can be used in gene therapy. This polynucl represents a NOVX DNA sequence of the invention

proteins can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arset, cerebrovascular disorders e.g. collar disorders e.g. corneal infection. The polypeptides can also be cused to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sumbur, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in a chemicaxis. The polypeptides can also be used as a food additive or chemicaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other mutitional components. The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at food supplement; medical imaging; diagnostic; genetic disorder; ss. CDNA libraries, useful chromosome and geor in generating New polynucleotide sequences obtained from various as hybridization probes, as oligomers for PCR, for mapping, in the recombinant production of protein, antisense DNA or RNA. WPI; 2003-615964/58

Jones LW;

Claim 1; SEQ ID NO 14076; 44pp; English.

38043 CDNA sequences, appearing as ACH12789-ACH50811, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also concluded is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polymcleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for are useful in diagnostics as expressed sequence tags (EST) for a fortifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide for engage and genes or for physical mapping of the human genome, in generating antisense DNA or RNA. The purified polypeptide for one mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is one of the 38043 isolated cDNA/RST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polypeptides have various cytokine-like activities, peptide therapy. The polypeptides have various cytokine-like activities, eg. stem cell growth factor activity, haematopoissis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Aricacicaagcricacriaaaarcarcagcaacagcggccarrccricaargrigacrirg

The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used itsorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used
                                                                                                                                                                                                                                                                                                                                        acids encoding 4277 human colon cancer-associated polypeptides, for preventing, diagnosing and/or treating colorectal cancers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises a method for diagnosing the presence of gastrointestinal cancers (e.g. cancers of the stomach, small intestine and colon) associated with two gastrointestinal specific genes (GSGS). The two GSGs are human galectin-4 (CIn114) and human carbonic anhydrase I (CIn115). It has been found that CIn114 and CIn115 serve as useful markers in the diagnosis of gastrointestinal cancer. The method of the invention is useful for detecting, diagnosing, monitoring, staging, prognosticating, imaging and treating gastrointestinal cancers associated with the expression of GSGS CIn114 and CIN15. The present DNA sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       509
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     552
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         to produce the colon cancer-associated Ps, by inserting the mucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH31196 to AAH37204 and AAB37789 represent sequences used in the exemplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027

The invention relates to a combination comprising cDNAs that are differentially expressed in colon disorder. The methods and compositions of the present invention are useful for diagnosing, treating, staging or monitoring treatment for colon cancer. They are also useful in high throughput methods for using cDNAs to detect differential expression of nucleic acids in a sample, screening molecules or compounds to identify a ligand which specifically binds a cDNA and using a protein to screen molecules or compounds to identify at least one ligand which specifically binds the protein. The present sequence represents a human cDNA differentially expressed in colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gergianeceairaceaaracaaraaceagreecergiraararaaaacagraaa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           differentially expressed in colon cancer. The invention is useful for producing and purifying antibody, utilized as markers for treatment efficacy against colon cancer. The invention is also useful for gene therapy. The present sequence is human carbonic anhydrase I (CAI) cDNI

```
The invention relates to methods for predicting toxic effects of compounds or the progression of these toxic effects by determining the compounds or the progression in tissues or cells exposed to the toxin and comparing these to gene expression in unexposed tissues or corns and compound or progression of a toxic effect, preferably the compound or progression of a toxic effect, preferably the expression in a tissue or cell sample exposed to the compound of two or expression in a tissue or cell sample exposed to the compound of two or more genes listed in the specification, where differential expression of the genes is indicative of at least one toxic effect or progression. The method can also be used to identify an agent which modulates the toxic cell. The methods utilise a set of at least two probes (on a solid support in kit form), where each of the probes comprises a sequence that specifically hybridises to a gene listed in the specification, a computer system comprising a database containing information identifying the expression level in a tissue or cell sample exposed to a hepatotoxin of a set of genes comprising at least two genes listed in the specification, and a user interface to view the information used to present information, identifying the expression level in a tissue or cell of at least one gene listed in the specification.
                                                                                                                                                                                                                                                                                                                                              Predicting toxic effects of compounds or the progression of these toxic effects by determining the changes in gene expression in tissues or cells exposed to the toxin and comparing these to gene expression in unexposed tissues or cells.
                                                                                                                                                                                                                                                                                 Castle AL,

changes in gene expression and for identifying toxicity markers in tissues or cell exposed to a known toxin. The genes may be used as toxicity markers in drug screening and toxicity assays. The genes and gene expression information may be used as diagnostic markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound or agent. Hepatotoxicity is to a hepatotoxic agent Sample when we would be a second and steatosis. The present characterised by centrilobular necrosis and steatosis. The present sequence is an expressed sequence tag (EST) or cDNA which is differentially expressed in response to a l

of a carbonic anhydrase homologue from the zebra
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Carbonate dehydratase (EC 4.2.1.1) I - rhesus macaque (tentative sequence)
N,Alternate names: carbonic anhydrase I
C,Species: Macaca mulatia (rhesus macaque)
C,Bpecies: Macaca mulatia (rhesus macaque)
C,Accession: A01139

C; Function:
A; Description: adalyzes the reversible dissociation of carbonic acid to carbon dioxide
A; Note: this form is expressed in erythrocytes and other tissues; deficiency of this for C; Superfamily: carbonate dehydratase; carbonic anhydrase homology
C; Superfamily: carbonate dehydratase; carbonic anhydrase homology ckpt.
C; Superfamily: carbonate dehydratase; I #status experimental chromatole carbonic anhydrase homology ckpt.
F; 2-250/Froduct: carbonate dehydratase II #status experimental chromatole site: acetylated amino end (Ser) (in mature form) #status experimental
F; 94, 96, 119/Binding site: zinc (His) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            majo

carbonate dehydratase (EC 4.2.1.1) II - mouse
N.Alternate names: carbonic anhydrase II
C;Species: Mus musculus (house mouse)
C;Date: 25-Feb-1985 #sequence revision 06-Feb-1995 #text_change 18-Jun-1999
C;Accession: A23900, B23202; A01143; A20539; I51949
R;Venta, P.J.; Montgomery, J.C.; Hewett-Emmet, D.; Wiebauer, K.; Tashian, R.E.
A;Title: Structure and exon to protein domain relationships of the mouse carbonic anhydrate for mouse number: A23900; MUID:86008276; PMID:2995362
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A; Modecule type: DNA

or gout. New isolated human lyase polypeptide for diagnosing, treating and preventing e.g. glaucoma, ocular hypertension, stroke, asthma, or

Claim 1; Page 96-97; 101pp; English.

The present sequence represents human lyase polypeptide (HLYA-1) encoded

```
by the polynucleotide given in ABA97691. The specification describes an isolated HIVA polypeptide or a nucleic acid that encodes it. The invention has cytostatic, nootropic, anticonvulsant, cerebroprotective, virucide, neuroprotective, anti-HIV, antiparkinsonian, antibacterial, antidiabetic, antiinflammatory, ophthalmological, hypotensive, antidiateric, antiinflammatory, ophthalmological, hypotensive, antiparstile, protozoacide, tranquilliser and neurological, thypotensive, antiparstile, protozoacide, tranquilliser and neurological, appointed in the protein of the invention may be used to screen for applications. The protein of the invention may be used to screen for potential HIVA agonists or antagonists, detect the presence of HIVA associated disorders; assess the toxicity of a test compound. The HLVA proteins and polynucleotides are useful in diagnosis, treatment and proteins and polynucleotides are useful in diagnosis, treatment and prevention of immunological disorders e.g. AIDS, allergy, anaemia, astrophy, bown's syndrome, multiple sclerosis, attentophy, bown's syndrome, mysthenia gravis; glaucoma. HLVA polynucleotides are used for creating humanised/transgenic animals to model human diseases; sometic or germline gene therapy; for generating chromosomal location due to e.g. translocation; generating at transcript inage of a tissue/cell type. Antibodies which bind to the HLVA proteins or monitoring are used for diagnosis of HLVA associated disorders or inhibitors of are used for diagnosis of HLVA asgonists, antegonists or inhibitors of the HLVA and for assessing toxicity of a test compound

Claim 1; Page 67; 672pp; English.

The invention relates to a novel isolated polypeptide, designated NOVX (NOV1 - 33), consisting of a mature form of one of 61 sequences, given in the specification, or its variant, where amino acid residue (8) in the variant differ from the mature form, provided that the variant differs in not more than 15 % of the amino acids from the sequence of the mature form. The NOVX polypeptides, nucleic acids encoding the polypeptides, and an antibody to the polypeptides, are useful for treating a preventing a NOVX-associated disorder in humans and for treating a syndrome associated with a human disease (NOVX-associated disorder). NOVX polypeptides and polymocleciated are useful for determining the presence of or predisposition to a disease associated with altered levels of NOVX polypeptide and polymocleciate, by measuring the level of polypeptide cypression or the amount of nucleic acid from a mammal and comparing it with another mammal not having or not predisposed to the disease. NOVX polypeptide is also useful for identifying an agent that binds to NOVX and a cell expressing NOVX is useful for identifying an agent that

```
modulates the expression or activity of NOVX. The antibodies and a polypopitide are useful to obygopitide are useful for determining the presence or amount of NOVX in a sample. NOVX to treating a pathological state in a mammal. The antibodies are also useful for determining the presence or amount of NOVX in a sample. NOVX polypopitides, polywoleotides and antibodies specific for the collypeptides are useful for treating or preventing disorders or syndromes including trauma, viral, bacterial, fungal, protozoal, and parasitic for the collypeptides are useful for treating or preventing disorders or syndromes including trauma, viral, bacterial, fungal, protozoal, and parasitic for infections. They can also treat disorders such as e.g., Alzheimer's disease or a stroke. The NOVX encoding nucleic acids are useful for expressing the NOVX proteins, to detect NOVX mapple, or a genetic lesion in consideration or skin or body fluids in forensic biological sample, to amplify the NOVX proteins are useful biological samples such as tissues e.g. hair or skin or body fluids in forensic biology and as primers and probes for use in identifying and/or cloning NOVX homologues in other cell crypes. The NOVX proteins are useful for diagnostically monitoring protein levels and modulating NOVX activity. Cells comprising NOVX mucleic acids are useful for studying the function and/or activity of NOVX protein and for identifying and/or evaluating modulators of NOVX protein activity. The NOVX mucleic acids can be useful in gene therapy. This sequence represents a NOVX contein of the invention

WPI; 2001-502867/55. N-PSDB; AAS30989. Polynucleotides encoding diagnostic and therapeutic proteins, e.g. erzymes, hormones and receptors, useful in diagnostics and therapeutics.

Claim 27; Page 399-400; 522pp; English.

The invention relates to polynucleotides (I) encoding diagnostic and therapeutic (DITHP) polypeptides (II), which include e.g. enzymes, and therapeutic (DITHP) polypeptides (II), which include e.g. enzymes, and proteins involved in growth and development and receptors. (I) and (II) may be used to treat disorders associated with decreased polypeptide expression by rectifying mutations or deletions in a patient's genome, that affect the activity of the DITHPs, by expressing inactive proteins or supplementing the patient's own production of them. (I) and (II) may be used to treat diseases, for example, cell proliferative disorder, crohn's disease, acquired immune deficiency syndrome (AIDS), lymphoma, con supplementing the produce the DITHPS, by inscribing the nucleic acids in the abost cell and culturing the cell to express the protein. (I) and into a host cell and culturing the cell to express the protein. (I) and its complementary sequences may also be used as DNA probes in diagnostic samples, and therefore which patients may be in need of restorative therapy. (II) may also be used as antigens in the production of therapy. (II) may also be used as antigens in the production of contraboles against DITHPS and activity. The anti-DITHP attrobodies may also be used as diagnostic agents for detecting the anti-DITHP antibodies may also be used as diagnostic agents for detecting the anti-DITHP antibodies may also be used as diagnostic agents for detecting the

New polypeptides, designated as NOVX, useful for diagnosing and treating infections, neurological diseases, cancer, allergy, and bone, immunological, skin, renal, brain, muscle and autoimmune disorders.

Claim 1; Page 66; 672pp; English.

The invention relates to a novel isolated polypeptide, designated NOVX (NOVI - 33), consisting of a mature form of one of one of 61 sequences, given in the variant differ fraction, or its variant, where amino acid residue(8) in the variant differ fraction, or its variant, where amino acid residue(8) in the variant differ fraction acids from the sequence of the mature of the mature acids from the sequence of the mature

molecules encoding such proteins. Sequences of the invention are useful cor diagnosing, treating or preventing disorders associated with aberrant expression of NZMS. The disorders treated include cell proliferative disorders such as diabetes, acquired immune disorders such as diabetes, acquired immune deficiency syndrome (AIDS), cardiovascular disorders such as atteriosclerosis, bypertension), gastrointestinal disorders (e.g. morexia, gastritis), neurological disorders (e.g. epilepsy, dementia), pulmonary disorders (e.g. embolism, asthma), reproductive or eye disorders. Polypebides of the invention is useful in a number of drug screening techniques and to analyse the proteome of a tissue or cell type. They are also useful as elements on a microarray. Polynucleotides of the invention are useful for creating knockin humanised animals or transgenic animals to model human diseases, in somatic or germline gene therapy, to generate a transcript correction due to translocation or inversion among normal, carrier or affected individuals and as hybridisation probes for mapping neurally occurring genomic sequences. The present sequence is human NZMS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240

AAP22316 to AAP22363 encode the human secreted proteins given in AAB63049

to AAB63096. AAB63097 to AAB63132 represent more human secreted proteins
and polypeptides homologous to them. Human secreted proteins have
activities based on the tissues and cells the genes are expressed in.

Examples of activities include: immunosuppressive; antiarthritic;
antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic;
carebroprotective; nootropic; neuroprotective; antibacterial; virucide;
tungicide; ophthalmological; and vulnerary. The polynucleotides and
proteins can be used to prevent, treat or ameliorate a medical condition

proteins can be used to prevent, treat or ameliorate a medical condition

c heep. They are also used in diagnosina pathological condition or
susceptibility to a pathological condition. Disorders which are diagnosed

c treated include autoimmune diseases e.g. rhematoria arthritis,
 hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders

c g. cerebral ischaemia, angiogenesis, nervous system disorders e.g.
Alzheimer's disease, infections caused by bacteria, viruses and fungi and
coular disorders e.g. corneal infection. The polypeptides can also be
used to aid wound healing and epithelial cell proliferation to prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     skin aging due to sunbirn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components AAP22317 to AAP22315 and AAB63048 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid molecules encoding 48 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and
cardiovascular disorder; cardiac arrest; cerebrovascular disorder; cerebral ischaemia; angiogenesis; nervous system disorder; infection; Alzheimer's disease; ocular disorder; corneal infection; wound healing; skin aging; food additive; preservative.

The invention comprises a method for diagnosing the presence of gastrointestinal cancers (e.g. cancers of the stomach, small intestine and colon) associated with two gastrointestinal specific genes (GSGs). The two GSGs are human galectin-4 (Cln114) and human carbonic anhydrase I (Cln115). It has been found that Cln14 and Cln115 serve as useful markers in the diagnosis of gastrointestinal cancer. The method of the invention is useful for detecting, diagnosing, monitoring, staging, prognosticating, imaging and treating gastrointestinal cancers associated with the expression of GSGs Cln114 and Cln115. The present amino acid sequence represents the human carbonic anhydrase I (Cln115) protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Diagnosing, monitoring, staging, imaging and treating cancers, e.g. gastrointestinal cancers such as stomach, small intestine and colon cancer, associated with the expression of gastrointestinal specific genes Cln114 and Cln115.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 VVHWNSDKYPSFVEAAHEPDGLAVLGVFLQIGEPNSQLQKITDTLDSIKEKGKQTRFTNF 180

differentially expressed in colon disorder. The methods and compositions of the present invention are useful for diagnosing, treating, staging or monitoring treatment for colon cancer. They are also useful in high throughput methods for using olDNAs to detect differential expression of nucleic acids in a sample, screening molecules or compounds to identify a ligand which specifically binds a cDNA and using a protein to screen molecules or compounds to identify at least one ligand which specifically binds the present sequence represents the amino acid sequence of a human cDNA differentially expressed in colon cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                combination comprising cDNAs that are differentially expressed in disorder, useful for diagnosing, treating, staging or monitoring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              invention relates to a combination comprising cDNAs that are
                                                                                                             Human cDNA differentially expressed in colon cancer #54 product.
                                                                                                                                         differential expression; colon cancer; cancer; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 14; SEQ ID NO 80; 231pp; English

The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P carcinomas and cancers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is given in a specification relating to a novel receptor-type protein tyrosine phosphatase beta (RPTPbeta) protein or glycoprotein. The receptor and its ligands are useful for developing compounds and strategies for modifying cellular processes e.g. normal cellular processes such as differentiation, metabolism, cell cycle control, wound healing and neuronal function, cellular behaviour such as metility, migration, and contact inhibition, in addition to abnormal or potentially deleterious processes such as virus-receptor interactions, inflammation, cellular transformation to a cancerous state, and the development of Type 2, insulla independent, diabetes mellitus, under the control of the receptor protein tyrosine phosphatases. The receptors or their ligands may be used directly to modulate processes such as those mentioned above. They act to compete with endogenous transmembrane receptor molecules for available ligands, thus reducing or inhibiting ligand binding to endogenous RPTPases and/or their ligands, may also be used to screen for additional molecules that can act to modulate
 DLLSLLPPSWDYWTYPGSLTVPPLLESVTWIVLKQPINISSQQLAKFRSLLCTAEGEAA 239
               Novel receptor type protein tyrosine phosphatase beta protein used to modulate normal cellular processes of differentiation, metabolism, cell cycle by competing with endogenous transmembrane receptors for ligands.
                                                                                                                                                                                             Human; protein tyrosine phosphatase; PTPase; vulnerary; cytostatic; antiinflammatory; antidiabetic; viral infection; inflammation; cancer; receptor-type protein tyrosine phosphatase beta; RPTPbeta; carbonic anhydrase; CAH; diabetes mellitus.

This construct can also include genes encoding for hydroxyapatite nucleating protein (HPP), calcium-binding protein (CBP), metal-binding protein (MBP) or biomineralisation protein (BP). These plants have increased growth rate, better crop yields and shorter maturation times
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SENVDEDDTENKSVLRGGPLTGSYRLRQVHLHWGSADDHGSEHIVDGVSYAAELHVVHWN 125

The present sequence is given in a specification relating to a novel receptor-type protein tyrosine phosphatase beta (RPTPbeta) protein or glycoprotein. The receptor and its ligands are useful for developing compounds and strategies for modifying cellular processes e.g. normal cellular processes such as differentiation, metabolism, cell cycle control, wound healing and neuronal function, cellular behaviour such as motility, migration, and contact inhibition, in addition to abnormal or potentially deleterious processes such as virus-receptor interactions, inflammation, cellular transformation to a cancerous state, and the development of Type 2, insulin independent, diabetes mellitus, under the control of the receptor protein tyrosine phosphatases. The receptors or their ligands may be used directly to modulate processes such as those mentioned above. They act to compete with endogenous transmembrane receptor molecules for available ligands, thus reducing or inhibiting also be used to screen for additional molecules that can act to modulate the activity of cellular processes
modulate normal cellular processes of differentiation, metabolism, cell cycle by competing with endogenous transmembrane receptors for ligands.

The invention discloses a composition comprising two or more isolated rate or human polynuclectides or a polynuclectide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynuclectide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a gent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a method for producing a pharmaceutical composition, a compound that regulates the activity of one or more of the content regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                      pain; neuronal tissue; gene therapy; segmental nerve injury; chronic constriction injury; CCI; nerve injury; SNI; Chung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ξ

polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (thung), chronic construction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at flp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                             182

derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynuclectide, a host cell comprising the vector, a method for identifying a nucleitide sequence which is differentially regulated in an animal subjected to pain and act in to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynuclectide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polynuclectides, a method for producing a pharmaceutical composition, a cethod for identifying a compound or small molecule that regulates the extra control of the polynoptides given in the activity in an animal of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides given in the appoint an method for identifying a compound useful in treating
                                                                                                                                                                                                                                                                                                                                                    pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (Chung), chronic constriction therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           185

combination comprising cDNAs that are differentially expressed in disorder, useful for diagnosing, treating, staging or monitoring colon disorder, useful for c treatment for colon cancers.

The invention relates to a combination comprising cDNAs that are differentially expressed in colon disorder. The methods and compositions of the present invention are useful for diagnosing, treating, staging or monitoring treatment for colon cancer. They are also useful in high throughput methods for using cDNAs to detect differential expression of nucleic acids in a sample, screening molecules or compounds to identify a ligand which specifically binds a compounds to identify at least one ligand which specifically binds the protein. The present sequence represents the amino acid sequence of a human cDNA differentially expressed in colon cancer Example 14; SEQ ID NO 117; 231pp; English. protein.
